Patterns

Three small, rectangular images are arranged horizontally in the center of the slide. They appear to be close-up shots of various materials or textures, possibly related to design or engineering concepts.

SOLID

Abstraction
Encapsulation

Modularity
hierarchy

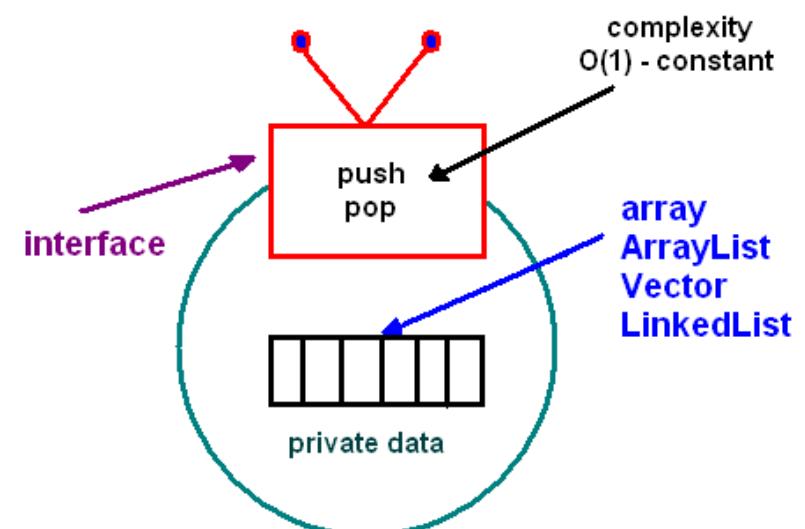

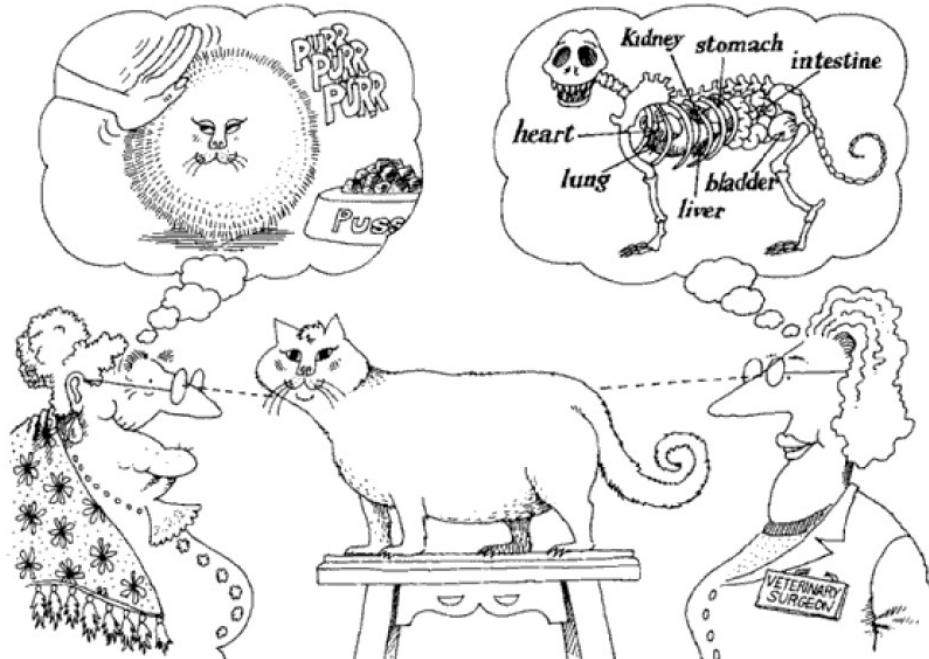

Pillars of OO

- Abstraction
- Encapsulation
- Modularity
- Hierarchy

Absntractio

Abstraction focuses upon the essential characteristics of some object, relative to the perspective of the viewer.

!! जाकी रही भावना
जैसी ..
प्रभु मूरत देखी तिन
तैसी !!

Encapsulation

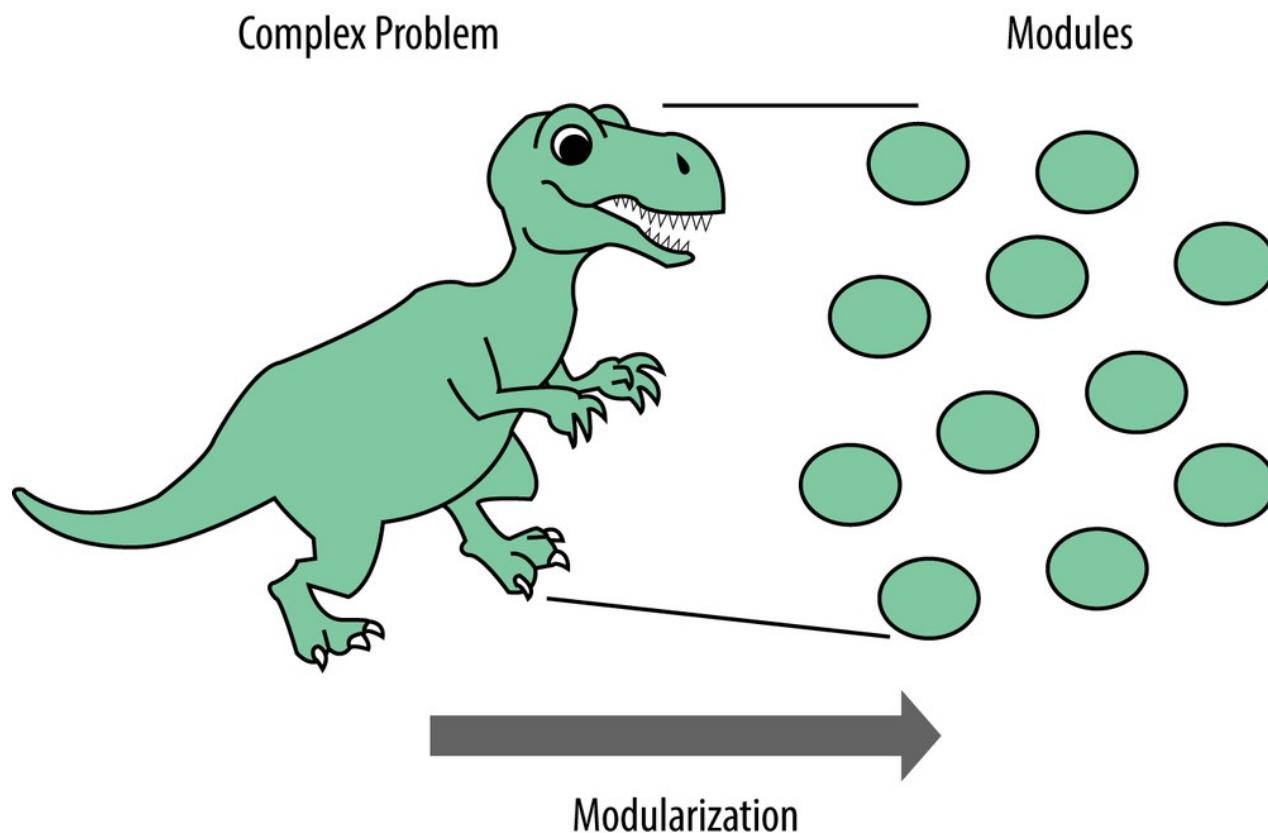

- Changing data in organized way, by using data hiding and applying business constraints
- Encapsulation= data hiding + constraints

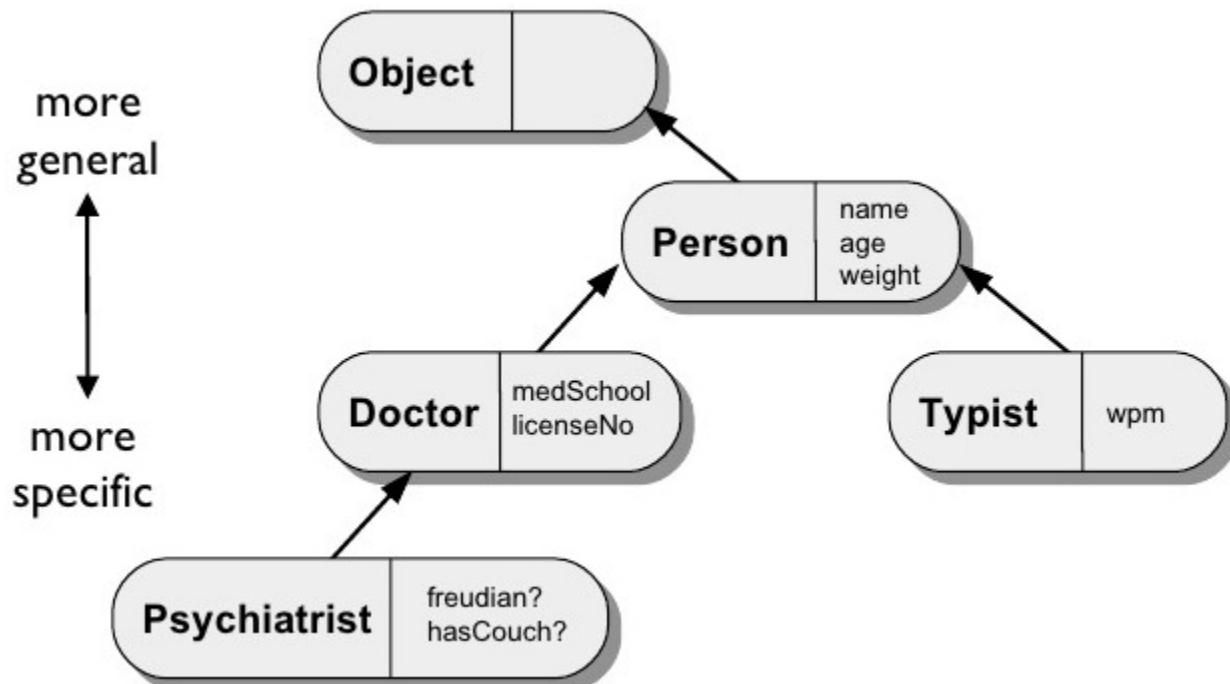

Abstraction vs Abstraction

Abstraction	Encapsulation
Abstraction is a general concept formed by extracting common features from specific examples or The act of withdrawing or removing something unnecessary .	Encapsulation is the mechanism that binds together code and the data it manipulates, and keeps both safe from outside interference and misuse .
You can use abstraction using Interface and Abstract Class	You can implement encapsulation using Access Modifiers (Public, Protected & Private)
Abstraction solves the problem in Design Level	Encapsulation solves the problem in Implementation Level
For simplicity, abstraction means hiding implementation using Abstract class and Interface	For simplicity, encapsulation means hiding data using getters and setters

We write code that is ...

Rigid

Fragile

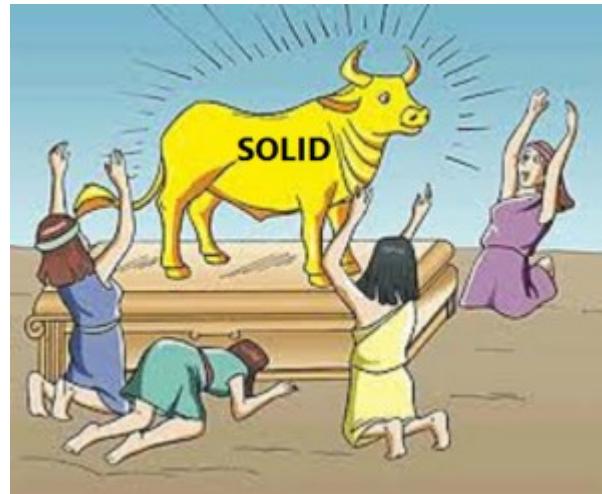

Immobile

Making everyone's life miserable

So WHY SOLID?

It helps us to write code that is ...

- Loosely coupled
- Highly cohesive
- Easily composable
- Reusable

SOLID

Coined by Robert C
Martin

Not new, existing
principles brought
together

Single Responsibility Principle (SRP)

Open Closed Principle (OCP)

Liskov Substitution Principle (LSP)

Interface Segregation Principle (ISP)

Dependency Inversion Principle (DIP)

Single Responsibility Principle

"There should be **NEVER** be more than **ONE** reason for a class to change"

Open Closed Principle

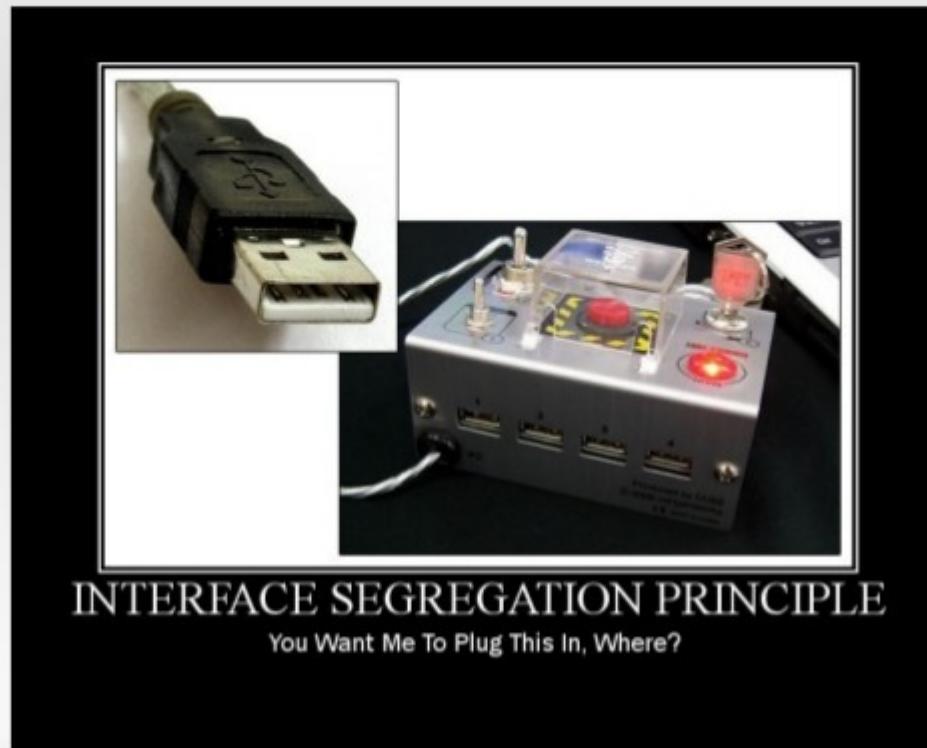

"Modules must be **OPEN** for extension,
CLOSED for modification"

Liskov Substitution Principle

"Base classes instances must be replaceable by the sub class instances without any change in the application"

Interface Segregation Principle

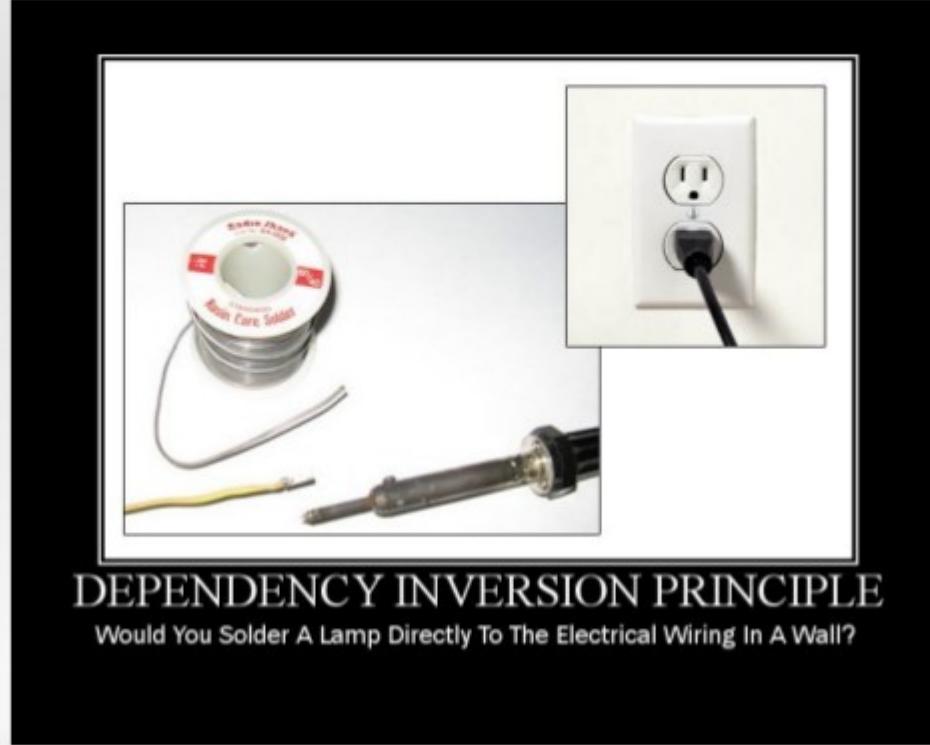

"Clients should not depend upon the interfaces they do not use"

How can we pollute the interfaces?

OR

How do we end up creating Fat interfaces?

Dependency Inversion Principle

"High level modules should not depend on the low level details modules, instead both should depend on abstractions"

Top 10 Object Oriented Design Principles

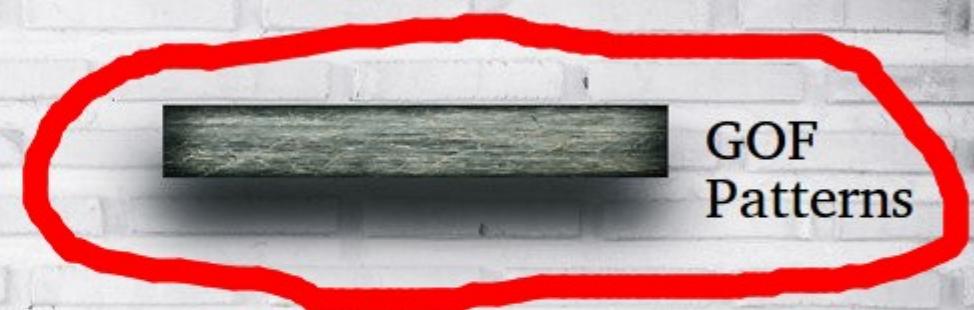

1. DRY (Don't repeat yourself) - avoids duplication in code.
2. Encapsulate what changes - hides implementation detail, helps in maintenance
3. Open Closed design principle - open for extension, closed for modification
4. SRP (Single Responsibility Principle) - one class should do one thing and do it well
5. DIP (Dependency Inversion Principle) - don't ask, let framework give to you
6. Favor Composition over Inheritance - Code reuse without cost of inflexibility
7. LSP (Liskov Substitution Principle) - Sub type must be substitutable for super type
8. ISP (Interface Segregation Principle) - Avoid monolithic interface, reduce pain on client side
9. Programming for Interface - Helps in maintenance, improves flexibility
10. Delegation principle - Don't do all things by yourself, delegate it

Design pattern

- Proven way of doing things
- **Gang of 4 design patterns ???**
- **total 23 patterns**
- **Classification patterns**
 - 1. **Creational**
 - 2. **Structural**
 - 3. **Behavioral**

Keep it simple (KISS)

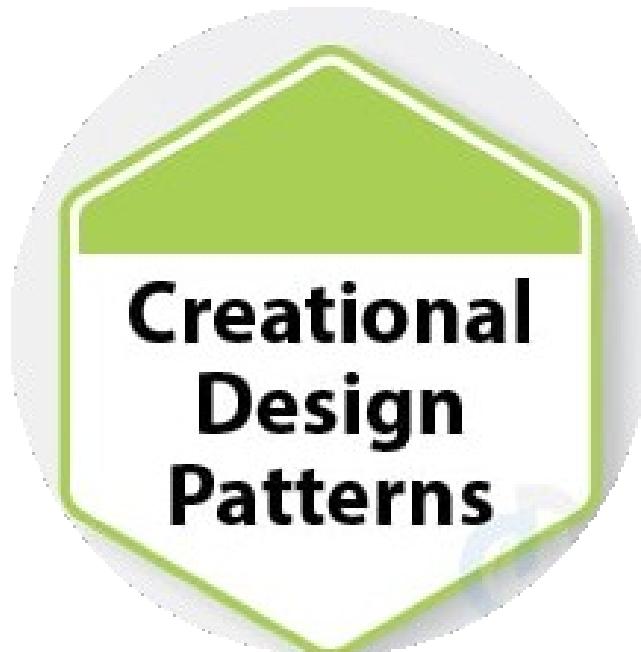

DESIGN PATTERNS – CLASSIFICATION

Structural Patterns	Creational Patterns	Behavioral Patterns
<ul style="list-style-type: none">• 1. Decorator• 2. Proxy• 3. Bridge• 4. Composite• 5. Flyweight• 6. Adapter• 7. Facade	<ul style="list-style-type: none">• 1. Prototype• 2. Factory Method• 3. Singleton• 4. Abstract Factory• 5. Builder	<ul style="list-style-type: none">• 1. Strategy• 2. State• 3. TemplateMethod• 4. Chain of Responsibility• 5. Command• 6. Iterator• 7. Mediator• 8. Observer• 9. Visitor• 10. Interpreter• 11. Memento

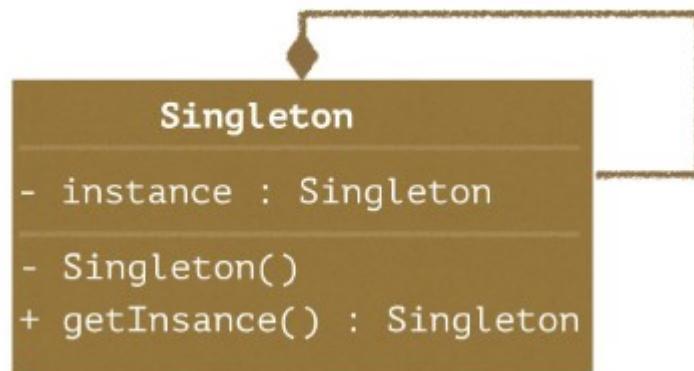

Patterns classification

- **Creational patterns?**
 - What is the **best way to create object** as per requirement
- **Structural patterns?**
 - Structural Patterns describe **how objects and classes can be combined to form larger structures**
- **Behavioral Patterns?**
 - Behavioral patterns are those which are concerned with **interactions between the objects** (talking to each other still loosely coupled)

Singleton Design Pattern

“Ensure that a class has only one instance and provide a global point of access to it.”

- `java.lang.Runtime#getRuntime()`
- `java.awt.Desktop#getDesktop()`
- `java.lang.System#getSecurityManager()`

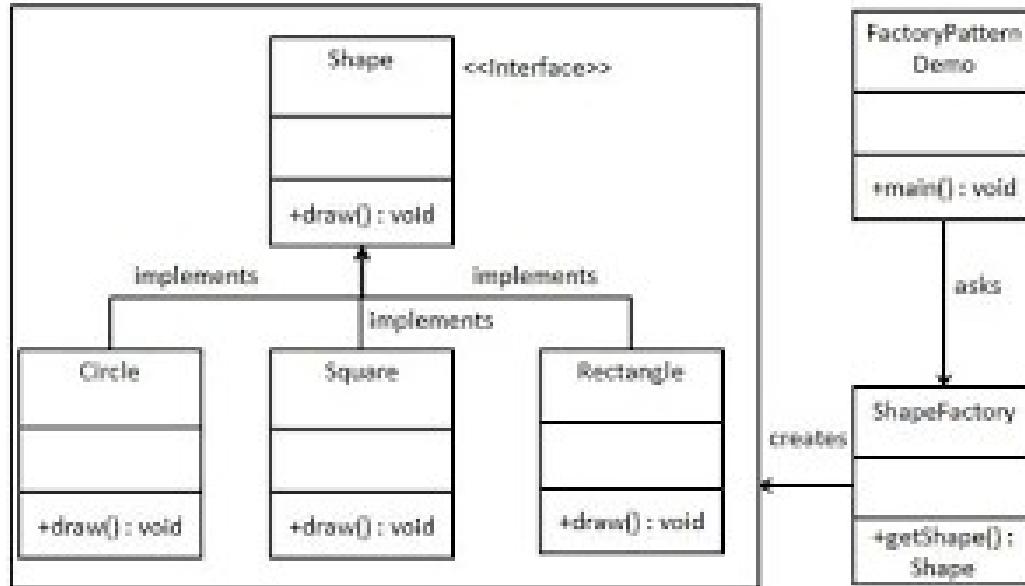

- ❖ Java Runtime class is used to *interact with java runtime environment*.
- ❖ Java Runtime class provides methods to execute a process, invoke GC, get total and free memory etc.
- ❖ There is only one instance of `java.lang.Runtime` class is available for one java application.
- ❖ The `Runtime.getRuntime()` method returns the singleton instance of Runtime class.

Singleton Design Consideration

- # Eager initialization
- # Static block initialization
- # Lazy Initialization
- # Thread Safe Singleton
- # Serialization issue
- # Cloning issue
- # Using Reflection to destroy Singleton Pattern
- # Enum Singleton
- # Best programming practices

Factory design pattern

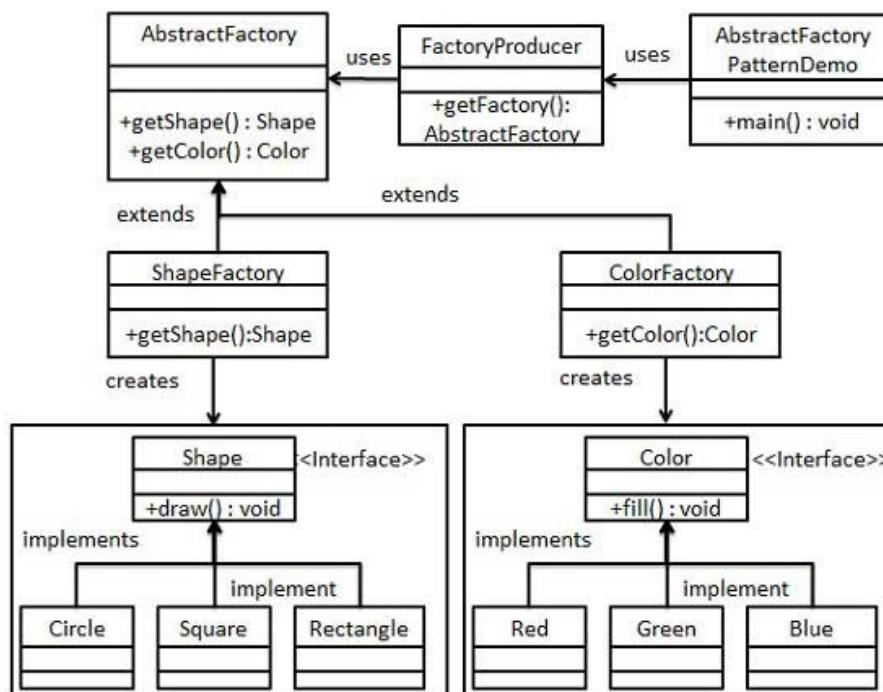

Factory(Simplified version of Factory Method) - **Creates objects without exposing the instantiation logic to the client and Refers to the newly created object through a common interface.**

Factory Method - **Defines an interface for creating objects, but let subclasses to decide which class to instantiate and Refers to the newly created object through a common interface.**

- `java.util.Calendar#getInstance()`
- `java.util.ResourceBundle#getBundle()`
- `java.text.NumberFormat#getInstance()`

Abstract Factory

Java: Abstract Factory. **Abstract Factory** is a **creational design pattern**, which solves the problem of creating entire product families without specifying their concrete classes. **Abstract Factory** defines an interface for creating all distinct products, but leaves the actual product creation to **concrete factory** classes.

- `javax.xml.parsers.DocumentBuilderFactory#newInstance()`
- `javax.xml.transform.TransformerFactory#newInstance()`
- `javax.xml.xpath.XPathFactory#newInstance()`

Builder Pattern

- The Builder pattern can be used to ease the construction of a complex object from simple objects.

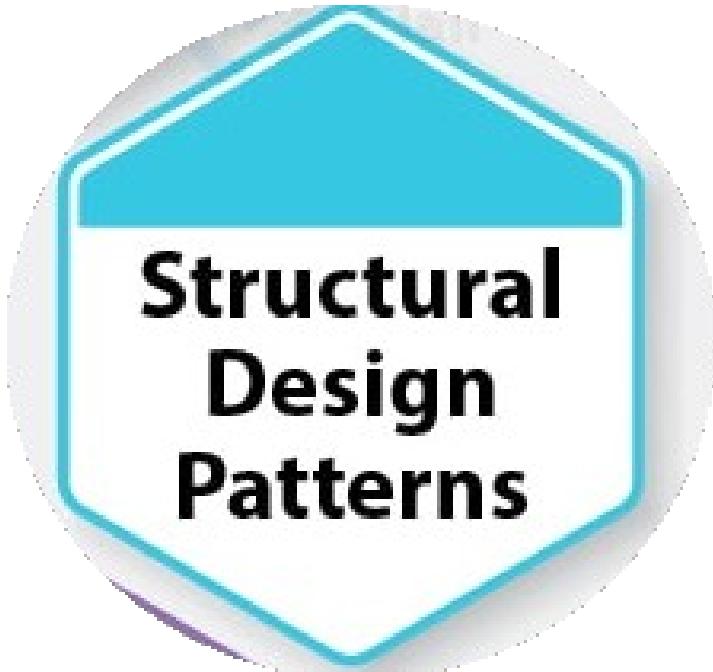

`java.lang.StringBuilder#append()` (unsynchronized)
`java.lang.StringBuffer#append()` (synchronized)

Prototype Pattern

- Cloning of an object to avoid creation. If the cost of creating a new object is large and creation is resource intensive, we clone the object.

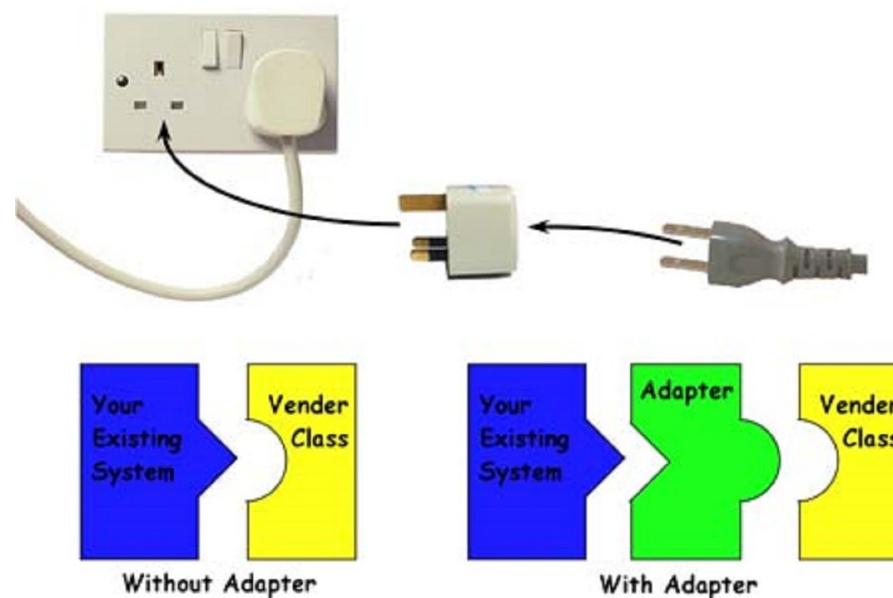

- `java.lang.Object#clone()` (the class has to implement `java.lang.Cloneable`)

Structural Design Patterns

Adapter Pattern

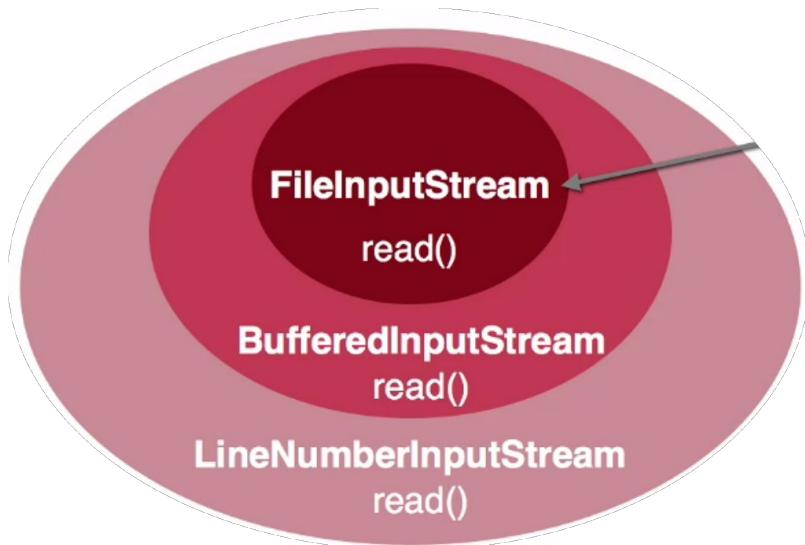

The Adapter pattern is used so that two unrelated interfaces can work together.

- `java.util.Arrays#asList()`
- `java.util.Collections#list()`
- `java.util.Collections#enumeration()`
- `java.io.InputStreamReader(InputStream)` (returns a `Reader`)
- `java.io.OutputStreamWriter(OutputStream)` (returns a `Writer`)

Decorator design pattern

- Series of wrapper class that define functionality, In the Decorator pattern, a decorator object is wrapped around the original object.

Adding behaviour statically or dynamically
Extending functionality without effecting the behaviour of other objects.
Adhering to Open for extension, closed for modification.

All subclasses of `java.io.InputStream`, `OutputStream`, `Reader` and `Writer` have a constructor taking an instance of same type.

`java.util.Collections`, the `checkedXXX()`, `synchronizedXXX()` and `unmodifiableXXX()` methods.

`javax.servlet.http.HttpServletRequestWrapper` and `HttpServletResponseWrapper`

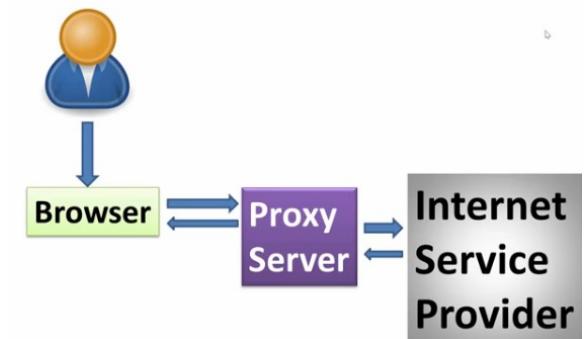

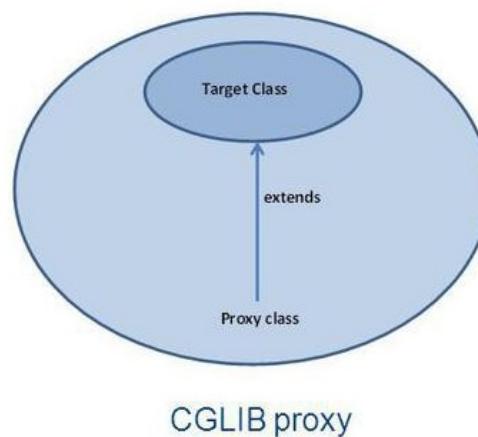

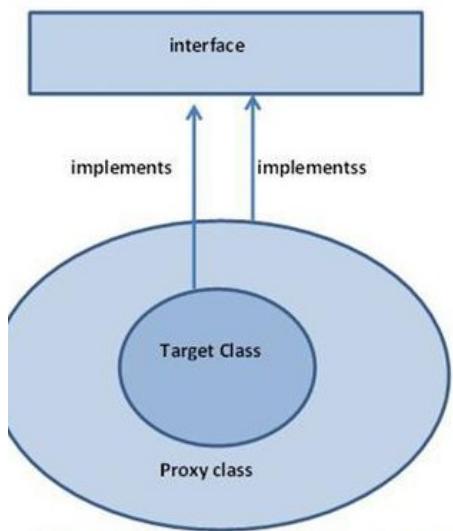

`javax.swing.JScrollPane`

Proxy design pattern

Proxy pattern, a class represents functionality of another class. This type of design pattern comes under structural pattern. In short, a proxy is a wrapper or agent object that is being called by the client to access the real serving object behind the scenes.

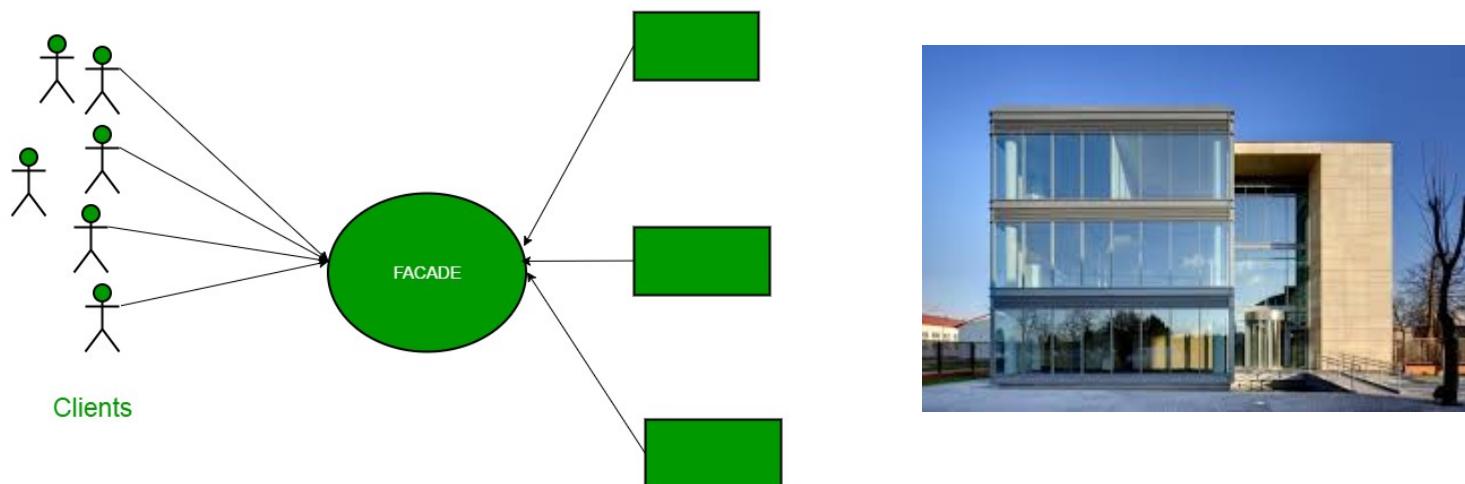

- In Spring Framework AOP is implemented by creating proxy object for your service.

[java.lang.reflect.Proxy](#)
[java.rmi.*](#)
[javax.ejb.EJB](#) (explanation here)
[javax.inject.Inject](#) (explanation here)
[javax.persistence.PersistenceContext](#)

Facade pattern

The **facade pattern** (also spelled as **façade**) is a **software-design pattern** commonly used with object-oriented programming. The name is an analogy to an architectural **façade**. A **facade** is an object that provides a simplified interface to a larger body of code, such as a class library.

- `javax.faces.context.FacesContext`, it internally uses among others the abstract/interface types `LifeCycle`, `ViewHandler`, `NavigationHandler` and many more without that the enduser has to worry about it (which are however overrideable by injection).
- `javax.faces.context.ExternalContext`, which internally uses `ServletContext`, `HttpSession`, `HttpServletRequest`, `HttpServletResponse`, etc.

Behavioral Design Patterns

Iterator design pattern

"The Iterator

Pattern provides a way to access the elements of an aggregate object sequentially without exposing the underlying representation"

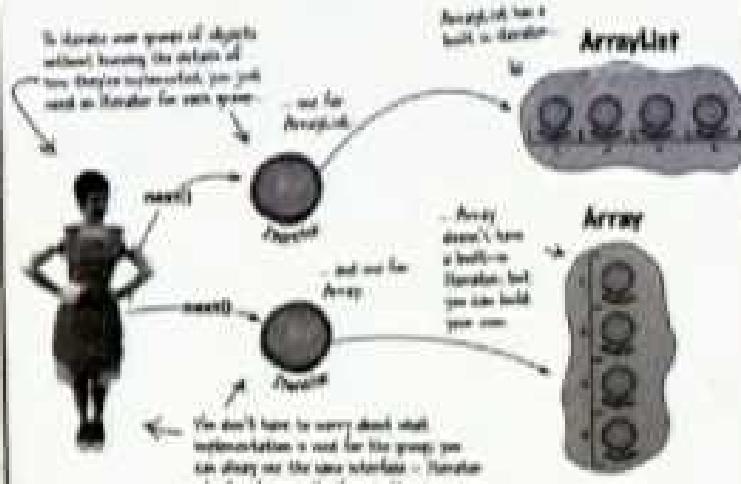

**Head First
Design Patterns
Poster
O'Reilly,
ISBN 0-596-10214-3**

 Turing.com.br

Iterator

336, 257

The Iterator Pattern provides a way to access the elements of an aggregate object sequentially without exposing its underlying representation.

Strategy pattern /policy pattern

Strategy - Define a family of algorithms, encapsulate each one, and make them interchangeable. Strategy lets the algorithm vary independently from clients that use it.

The screenshot shows a shopping cart page with two items:

ITEM	PRICE	QUANTITY	TOTAL
Lana Leopard Lace Tee Style: 570113309 SKU: 451004831976 Color: Summerberry Size: Size 1 (8/10, S)	\$55.00	1	\$55.00
Easy Cotton Tyree Shirt Style: 570105245 SKU: 451004495130 Color: Mysterious Blue Size: Size 1.5 (10, S)	\$39.50	1	\$39.50

On the right side, there is an "Order Summary" section showing:

ITEM SUBTOTAL	\$94.50
ESTIMATED TOTAL (BEFORE TAX) \$94.50	

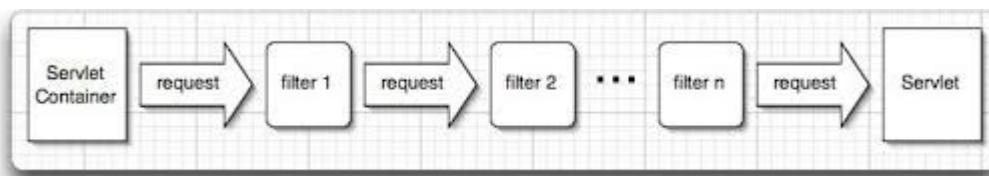

A "Promotion Code" input field with an "APPLY" button is also present. Below the summary, there is a promotional banner for "shoe SALE! 50% OFF Select Styles".

At the bottom, there are "CHECKOUT" buttons for both sections, and a "Need Help?" section with links for "CLICK TO CHAT" and "CLICK TO CALL".

- `java.util.Comparator#compare()`, executed by among others `Collections#sort()`.
- `javax.servlet.http.HttpServlet`, the `service()` and all `doXXX()` methods take `HttpServletRequest` and `HttpServletResponse` and the implementor has to process them (and not to get hold of them as instance variables!).

Chain of Responsibility

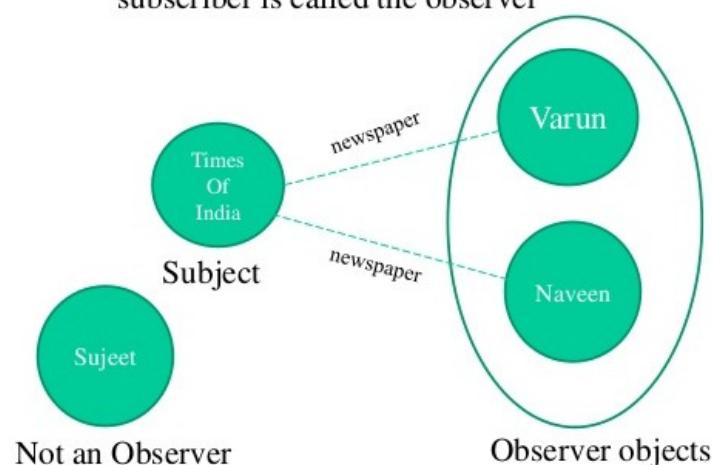

Chain of responsibility pattern is used to achieve loose coupling in software design where a request from client is passed to a chain of objects to process them.

Observer Design pattern

Observer design pattern is useful when you are interested in the state of an object and want to get notified whenever there is any change.

- Publisher + Subscribers = observer pattern
- In observer pattern publisher is called the subject and subscriber is called the observer

- `java.util.Observer / java.util.Observable` (rarely used in real world though)
- All implementations of `java.util.EventListener` (practically all over Swing thus)
- `javax.servlet.http.HttpSessionBindingListener`
- `javax.servlet.http.HttpSessionAttributeListener`
- `javax.faces.event.PhaseListener`

Template Design Pattern

Template Method - Define the skeleton of an algorithm in an operation, deferring some steps to subclasses / Template Method lets subclasses redefine certain steps of an algorithm without letting them to change the algorithm's structure.

Pattern vs. Framework

- Pattern is a set of guidelines on how to architect the application
- When we implement a pattern we need to have some classes and libraries
- **Thus, pattern is the way you can architect your application.**
- Framework helps us to follow a particular pattern when we are building a web application
- These prebuilt classes and libraries are provided by the MVC framework.
- **Framework provides foundation classes and libraries.**

Library vs Framework

Java Reflection

Java Reflection:

- => Reflection is aka class manipulator?
 - => Used to manipulate classes and everything in a class
 - => Can slow down a program because the JVM can not optimize the code
 - => Can not used with applets
 - => Should be used sparingly
- What is Java reflection?

"Reflection is the process of analysing the capabilities of a class at runtime"

That is analysing the details about the class which include the methods in the class, the variables of the class, the constructors in the class, the interface that the class is implementing, the methods that are coming from the interface

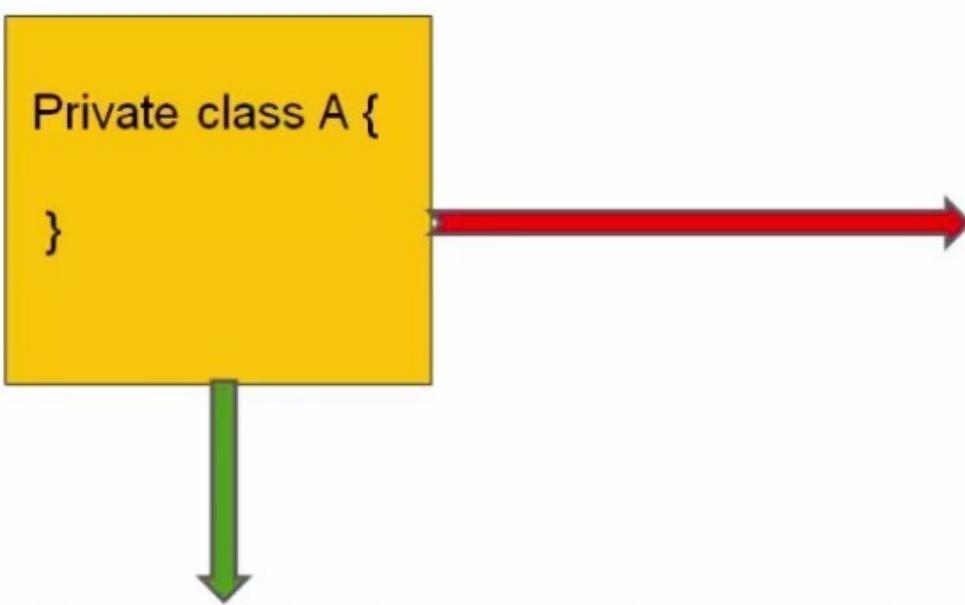

To gather all the above details is provided by reflection api

Reflection api is not the project development but used for PRODUCT development

Example application area:

JVM development, server design, framework design, tool design, compiler

Java Reflection

COMPILER:

The compiler will read this class according to the CLASS RULES defined in the compiler.

CLASS RULES

Can have only PUBLIC and DEFAULT access modifier in outer class. Will not allow PRIVATE OR PROTECTED access modifier for outer class. This rule is analysed by the REFLECTION API present in the compiler and it shows an error “MODIFIER PRIVATE not allowed”

Similarly rules for methods in the class, constructors in the class, interfaces inherited by the class, super classes extended by the class are also present and their access modifiers are also checked by REFLECTION API present in the compiler

Java Reflection

Reflection Package

java.lang.reflect package provides classes for performing reflection api.

Some classes in this reflect packages are :

java.lang.Class :

base class to perform reflection api.

This is used together to get metadata information about class

java.lang.reflect.Field:

Complete declarative information of a particular variable ie.

metadata of a particular variable like access modifier, datatype,
value and name of variable etc

java.lang.reflect.Method:

complete declarative information about a method ie. is able to store metadata

about methods, method names, access modifier, return type, parameters in method,
exception thrown etc

java.lang.reflect.Constructor:

information about constructs like name of constructors, access modifier, parameter type

java.lang.reflect.Modifier:

complete metadata about access modifier

Java Reflection

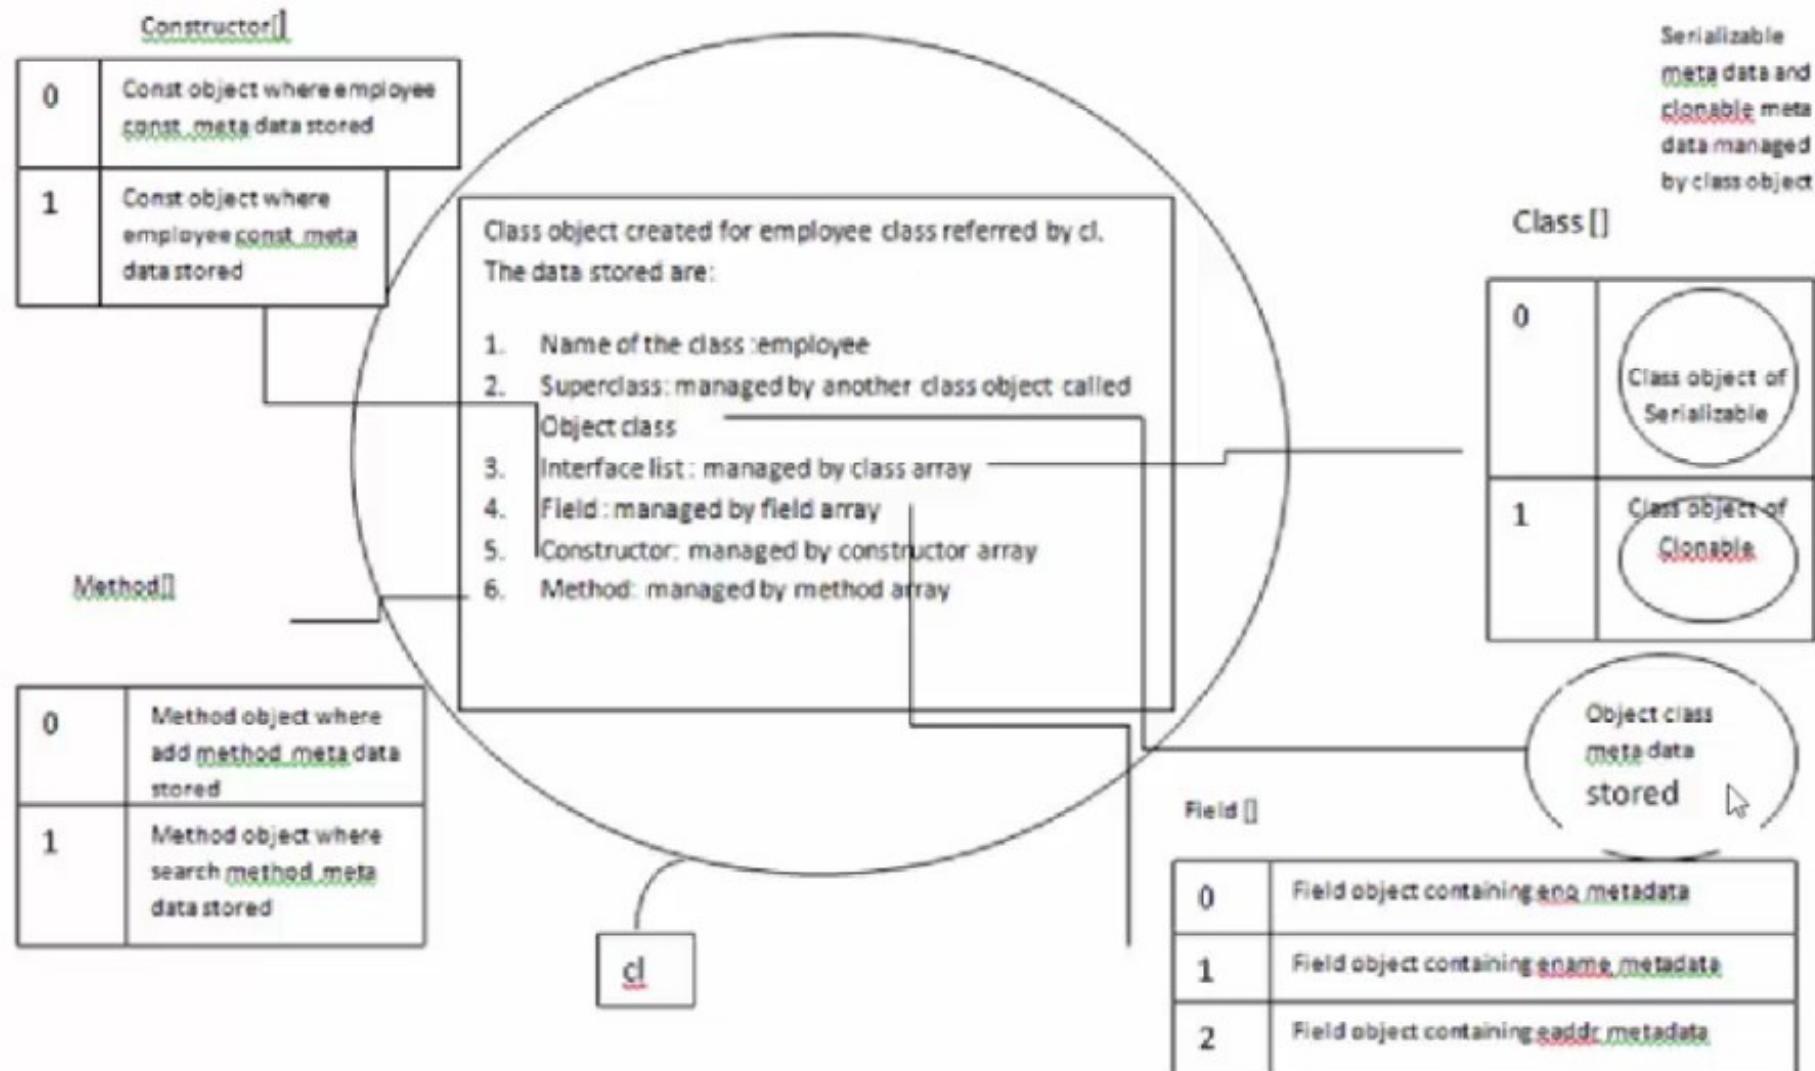

```
public class Employee implements Serializable, Cloneable{
    // variable ==4
    public int empNo;
    public static int companyName;
    public String name;
    public final String add="delhi";

    // ctr==2
    public Employee(int empNo, String name) {
        this.empNo = empNo;
        this.name = name;
    }
    public Employee() {}

    // methods==2
    public void add(int id, String name, String address){
    }
    public Employee search(int id){return new Employee();}

}
```

Java Reflection

Changing behaviour at runtime

Anyway, reflection does not allow you to change code behaviour, it can only explore current code, invoke methods and constructors, change fields values, that kind of things.

If you want to actually change the behaviour of a method you would have to use a bytecode manipulation library such as ASM. But this will not be very easy, probably not a good idea...

Patterns that might help you :

- If the class is not final and you can modify the clients, extend the existing class and overload the method, with your desired behaviour. Edit : that would work only if the method were not static !
- Aspect programming : add interceptors to the method using AspectJ

Anyway, the most logical thing to do would be to find a way to modify the existing class, work-arounds will just make your code more complicated and harder to maintain.

Annotation

Annotations starting from 5.0.

This feature was added to Java 5.0 as a result of the JSR 175 namely “A Metadata Facility for the JavaTM Programming Language”.

Built-in Annotations in Java

@Override
@Deprecated
@SuppressWarnings
@Target
@Retention
@FunctionalInterface

User-defined Annotations

```
Target({ElementType.FIELD, ElementType.LOCAL_VARIABLE})
public @interface Persistable{
    String fileName() default "defaultMovies.txt";
}
```

Any questions?
